Data

Data source: Radiology Society of North America(RSNA) and Radiology Informatics Committee (RIC). Available in Kaggle. Images gathered by several

Dataset: 12,621 images of individuals aged between 1 month and 19 years (228 months) old. Gender and age available for all fo them.

Context: Images gathered for the Pediatric Bone Age ML Challenge.

Aim(s) of my study

Supervised question #1: How close can we estimate age from images only?

Unsupervised question#1: Can clustering algorithm accurately group together individuals by gender

Unsupervised question#2: Unsupervised learning for out-of-the-box applications in computer vision

(Appendix) Supervised question #2: Can gender be derived from the image?

The images

X-ray images of each individuals' hand (one or two - information not available)

- Difficulties:
 - Varying resolution
 - Varying contrast
 - Varying exposure
 - Some scanned and some digital images
- Advantages:
 - Standardised medical images

Let's have a look at some pictures!

Centering and scaling

It is widely recommended to center and scale the inputs of a neural networks as this will speed up training by gradient descent (see notes from CS231n Stanford).

In this work: Images are centered and scaled w.r.t. their mean and standard deviation.

Limitations and further work

Appendi

Centering and scaling

Until further noticed all results from neural networks come from images centered with the mean and scaled with the standard deviation.

Note! where images have low exposure, most normalised pixel value will become negative and clipped to 0 when plotted!

Network of choice: ResNet

Residual networks were introduced by reserachers at Microsoft in 2015 (see He et al. (n.d.)). They represented a breaktrough at the time because they allow to train deeper network with an added trick which added no cost to the training computationally. ResNets are made of blocks such as the one below:

Figure 1. A RestNet basic block

Deep Learning for Computer Vision

Unsupervised Learning

Discussion

Limitations and further work

Appendix

Exponentially growing possibilites

The 'Caviar' approach: training many many models with different hyperparameters, seeing which one does best. I tried:

- ▶ Varying ResNet Depth: 18, 34, 50 layers.
 - IN, $\alpha=$ 1,ExponentialLR schedule, $\gamma=$ 0.7, ADAM optimizer, no weight decay
- ▶ Changing LR schedule: ReduceOnPlateau, StepLR with different γ (0.1 and 0.5) and stepsize (1,4,9,16,25).
- Moving into smarter ideas: CyclicLR, LR Range finder and One cycle policy.
